Design Note

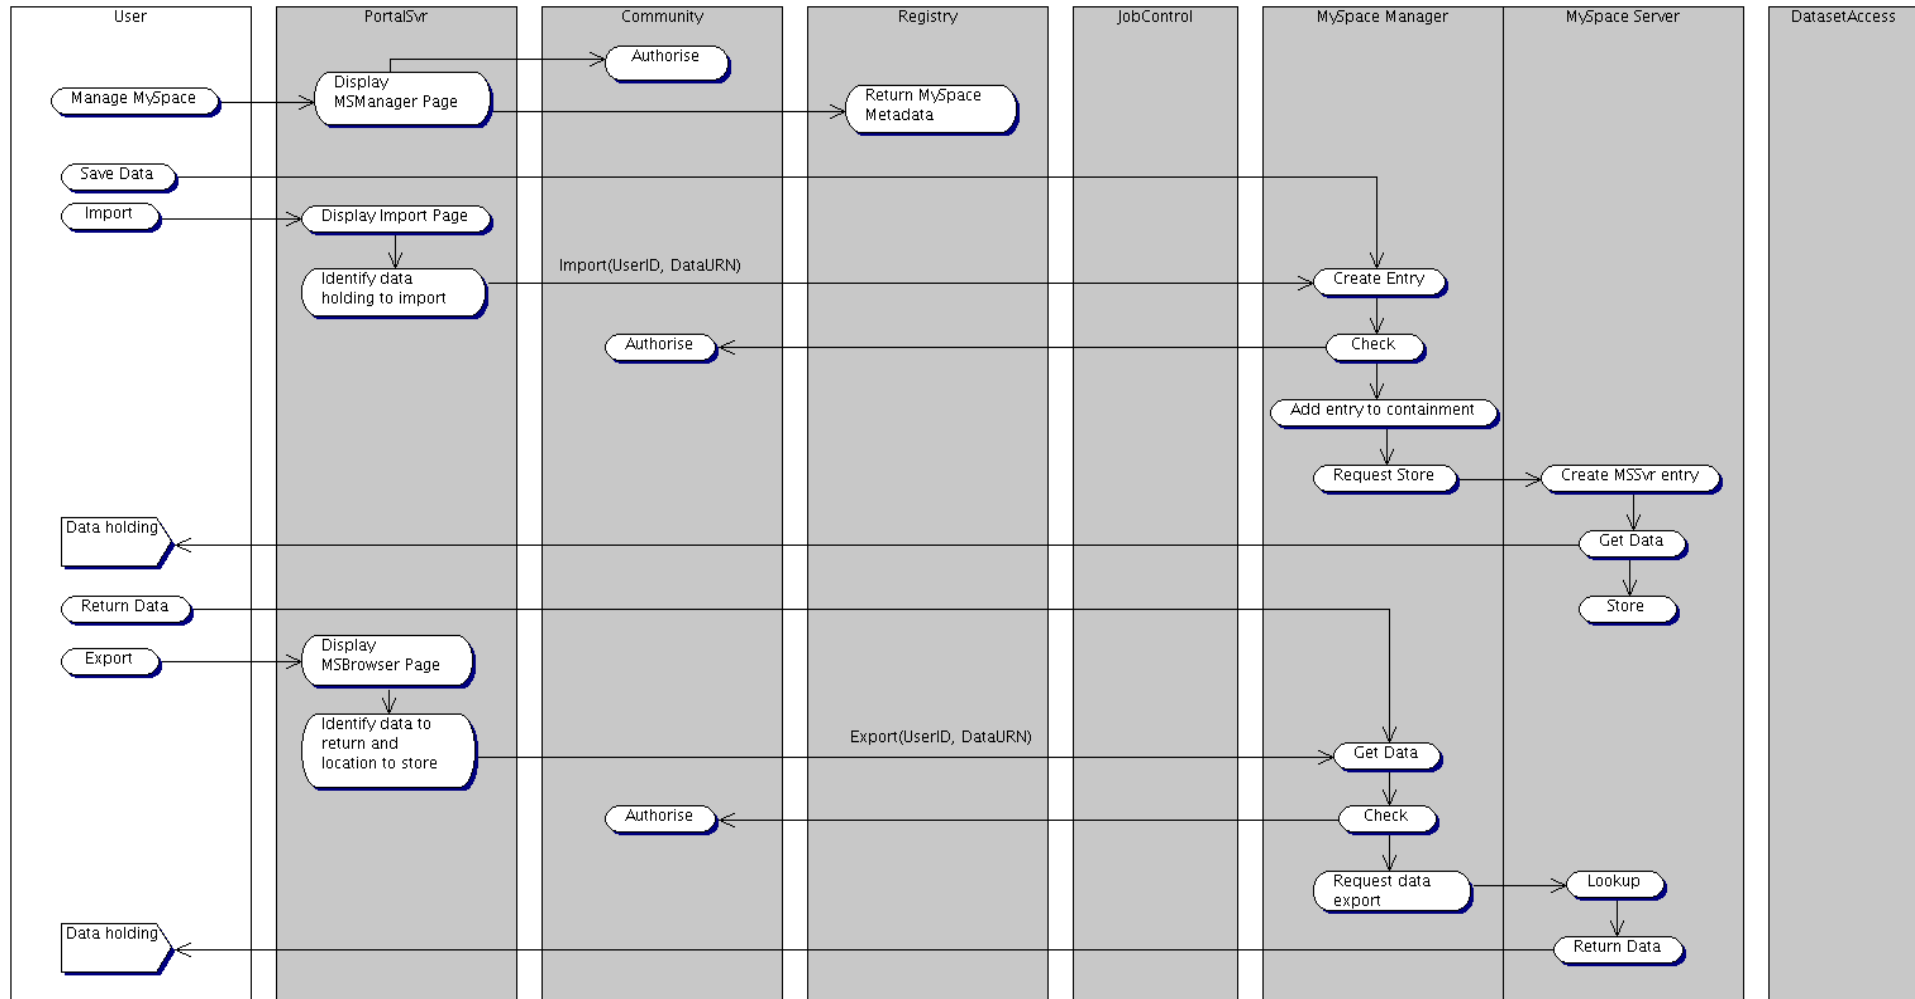

MSManager entries and MSServer entries are in a 1::1 relationship i.e. only the owner has a pointer direct to the MSServer entry (and back).

The MSManagers of other users sharing access to a particular data holding will point to the owner's MSManager entry.

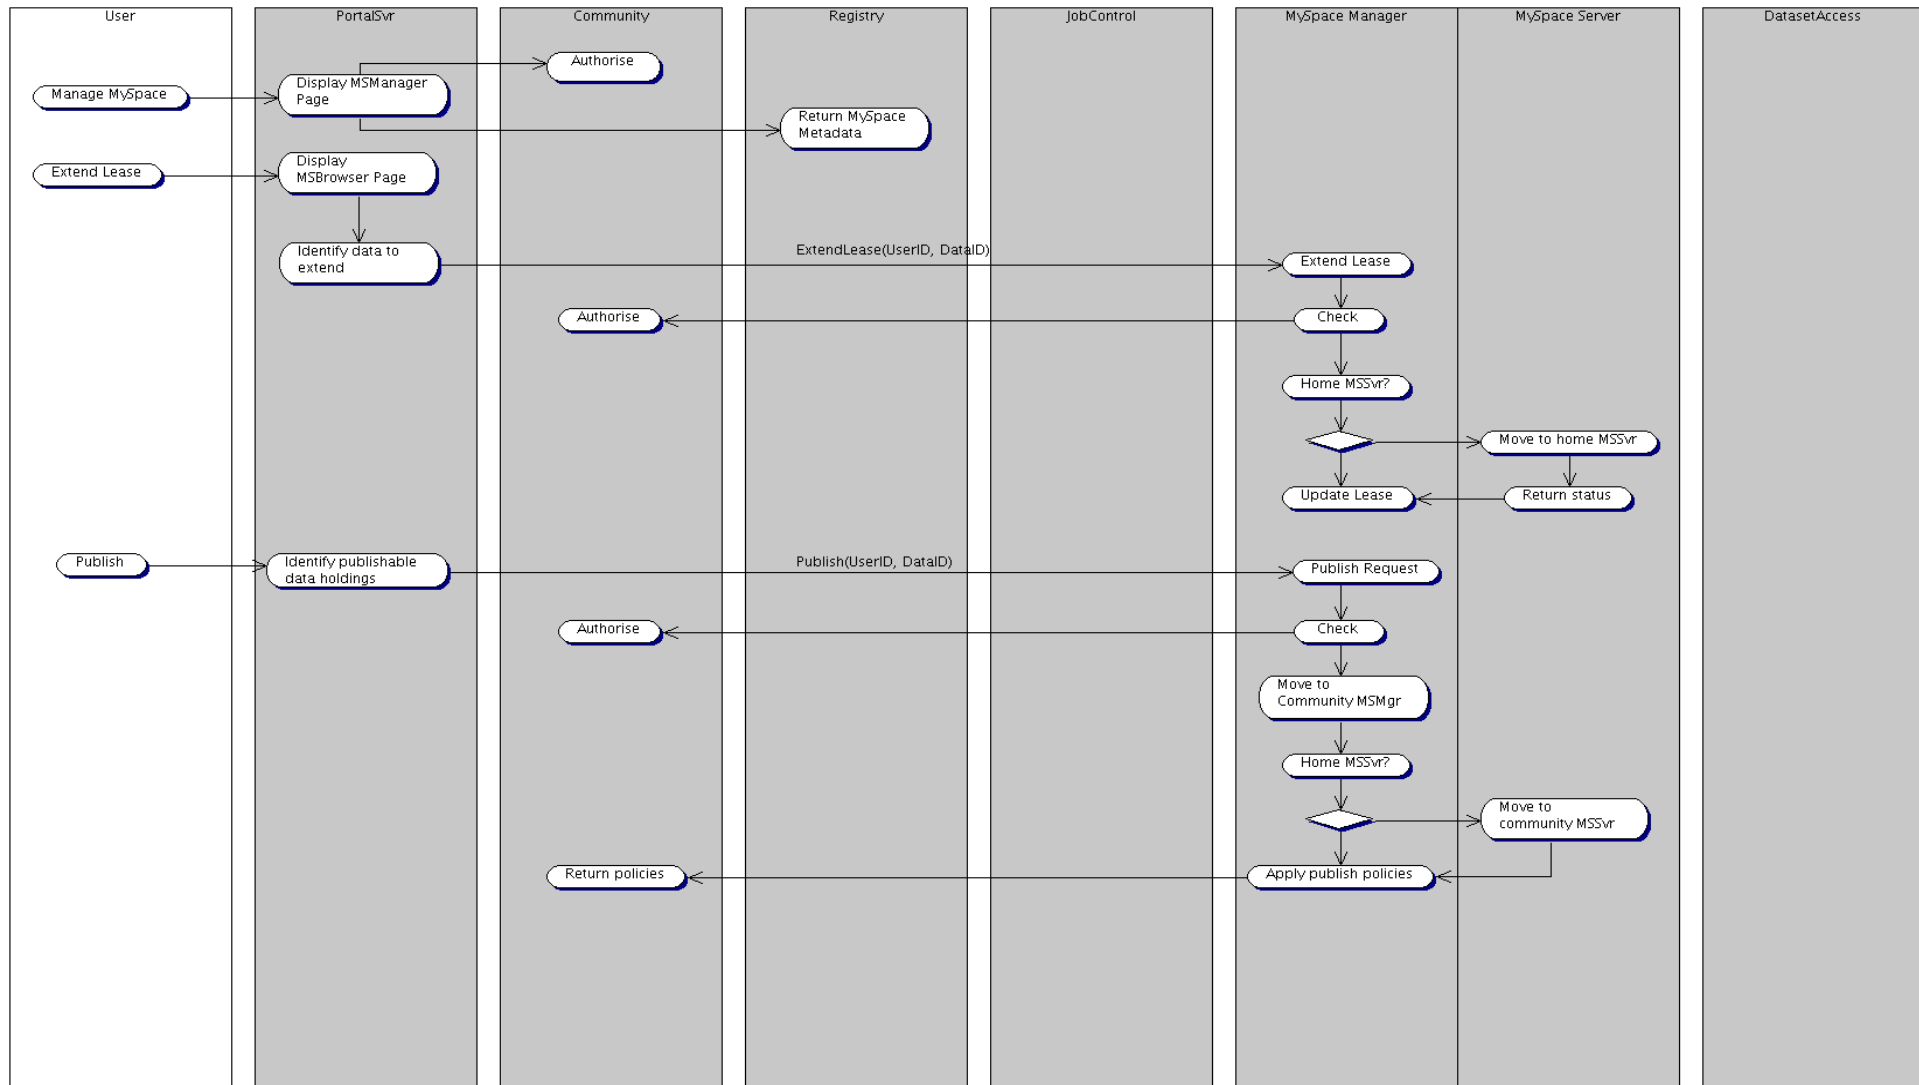

This means the actual data holding can be moved with minimal administrative overhead and provides a single point of entry to managing authorisation.

Note that this does not preclude changing ownership if required.
